

## Lab 7 Class Discussion Problem (Group Strategy)

---

Acme is a young company that is growing quickly. In the last 3 months they have employed another 40 people and have decided to divide the old Production division and create two new independent divisions: Research & Development and Factory. Each division needs to store their data in their own shared folder. The R&D division will need read/write access to the R&D data and read only access to the Factory data. Similarly, the Factory division will need read/write access to the Factory data and read only access to the R&D data.

# General Approach to Analyse Scenario

---

1. What are the resources that need to be made available?
2. What are the groups of users that need to be catered for?
3. What type of access do the groups need to the resources?
4. What domain structure does our solution design need to work within?
